Python vs Java in Software Engineering

Python		Java
Python is an interpreted language, making debugging and review easier.	Language Type	Java is a compiled language. It translates source code into machine code before execution.
It is dynamically typed, which means data types are determined at runtime.	Type System	Java is statically typed, requiring explicit type declarations during compilation.
Its syntax is easy to remember, almost similar to human language.	Syntax	Java's syntax is more complex, and it throws errors if you miss semicolons or curly braces.
Has fewer frameworks compared to Java. Popular ones include Django and Flask.	Framework	Offers a wide range of frameworks, such as Spring and Hibernate.
Generally requires fewer lines of code for the same functionality.	Code Length	Often involves longer lines of code.
